

One-sided versus two-sided readings  
of *many* and *few*

Hans Smessaert and Lorenz Demey

LNAT3, February 5-6, 2015, Brussels

## Aims of this talk:

- discuss Béziau's (unpublished LNAT1) proposal to transpose his results on the logical geometry of the modal logic S5 to that of the subjective quantifiers *many* and *few*
- propose an alternative analysis of *many* and *few*, which seems to fare equally well from a strictly logical perspective, but which we argue to be more in line with certain linguistic desiderata
- compare the two analyses in terms of two scales:
  - scale of semantic complexity
  - scale of lexical complexity
- compare the two analyses in terms of the types of Aristotelian diagrams they generate

- 1 Introduction
- 2 One-sided readings of “many” and “few”
- 3 Two-sided readings of “many” and “few”
- 4 Semantic versus lexical complexity
- 5 Aristotelian diagrams for “many” and “few”
- 6 Conclusion

1 Introduction

2 One-sided readings of “many” and “few”

3 Two-sided readings of “many” and “few”

4 Semantic versus lexical complexity

5 Aristotelian diagrams for “many” and “few”

6 Conclusion

| S5-formula                      | bitstring | FOL-quantifier      |
|---------------------------------|-----------|---------------------|
| $\Box p$                        | 100       | <i>all</i>          |
| $\neg \Box p$                   | 011       | <i>not all</i>      |
| $\neg \Diamond p$               | 001       | <i>no</i>           |
| $\Diamond p$                    | 110       | <i>at least one</i> |
| $\Box p \vee \neg \Diamond p$   | 101       | <i>no or all</i>    |
| $\neg \Box p \wedge \Diamond p$ | 010       | <i>some</i>         |

*some*  $\equiv$  *at least one but not all*     $010 = 110 \wedge 011$     **two-sided**  
*at least one*  $\equiv$  *some or all*     $110 = 010 \vee 100$     **one-sided**

| S5-formula                      | bitstring | FOL-quantifier          |
|---------------------------------|-----------|-------------------------|
| $\Box p$                        | 1000      | <i>all</i>              |
| $\neg \Box p$                   | 0111      | <i>not all</i>          |
| $\neg \Diamond p$               | 0001      | <i>no</i>               |
| $\Diamond p$                    | 1110      | <i>at least one</i>     |
| $\Box p \vee \neg \Diamond p$   | 1001      | <i>no or all</i>        |
| $\neg \Box p \wedge \Diamond p$ | 0110      | <i>some</i>             |
| $p$                             | 1100      | <i>many<sub>1</sub></i> |
| $\neg p$                        | 0011      | <i>few<sub>1</sub></i>  |

| level | S5-formula                                    | bitstring | subjective quantifier              |
|-------|---|-----------|------------------------------------|
| L2    | $p$   | 1100      | $many_1$                           |
|       | $\neg p$                                      | 0011      | $few_1$                            |
| L1    | $p \wedge \neg \Box p$                        | 0100      | $many_1$ but not all               |
|       | $\neg p \wedge \Diamond p$                    | 0010      | at least one but $few_1$           |
| L3    | $\neg p \vee \Box p$                          | 1011      | all or $few_1$                     |
|       | $p \vee \neg \Diamond p$                      | 1101      | no or $many_1$                     |
| L2    | $\Box p \vee (\neg p \wedge \Diamond p)$      | 1010      | all or (at least one but $few_1$ ) |
|       | $\neg \Box p \wedge (p \vee \neg \Diamond p)$ | 0101      | no or ( $many_1$ but not all)      |

The conjunctions  $many_1$  but not all and at least one but  $few_1$  create the L1 elements 0100 and 0010 by excluding the extreme values of the tripartition, i.e. all (1000) and no (0001), respectively.

- entailments in S5
  - from L1 'necessity' (1000) to L2 'actual truth' (1100)
  - from L1 'impossibility' (0001) to L2 'actual falsehood' (0011)
- analogous entailments for subjective quantifiers
  - from L1 *all* (1000) to L2 *many*<sub>1</sub> (1100)
  - from L1 *no* (0001) to L2 *few*<sub>1</sub> (0011)
- suppose that John has read all three books in the universe of discourse
  - *John has read all books* is obviously true
  - *John has read many books* is very likely to be considered false ('three books' does not really count as 'many books')
- suppose that John has read none of the books in the univ. of discourse
  - *John has read no books* is obviously true
  - *John has read few books* is much less obvious (conflict with the existential presupposition of *few*)
  
- **solution**: two-sided readings for *few* and *many*

- 1 Introduction
- 2 One-sided readings of “many” and “few”
- 3 Two-sided readings of “many” and “few”
- 4 Semantic versus lexical complexity
- 5 Aristotelian diagrams for “many” and “few”
- 6 Conclusion

$many_2 = 0100 = \text{two-sided L1 incompatible with } all = 1000$   
 $few_2 = 0010 = \text{two-sided L1 incompatible with } no = 0001$

level 2 **disjunctions** = lexically complex expressions,  
 cfr. English *little or no*; Dutch *weinig of geen* and French *peu ou pas*

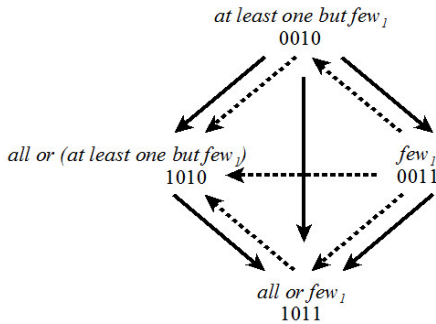

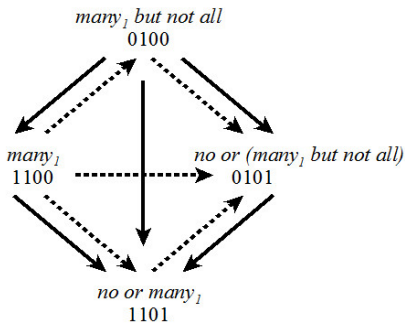

$many_2 \text{ or } all / many_2 \text{ if not } all \quad 0100 \vee 1000 = 1100 \quad \equiv \quad many_1$   
 $few_2 \text{ or } no / few_2 \text{ if any} \quad 0010 \vee 0001 = 0011 \quad \equiv \quad few_1$   
 $many_2 \text{ or } few_2 \quad 0100 \vee 0010 = 0110 \quad \equiv \quad some$

## Two-sided readings of “many” and “few”

| level | Béziau's analysis   | bitstring    | alternative analysis   |
|-------|---|--------------|--|
| L2    | <i>many<sub>1</sub></i><br><i>few<sub>1</sub></i>   | 1100<br>0011 | <i>many<sub>2</sub> if not all</i><br><i>few<sub>2</sub> if any</i>                  |
| L1    | <i>many<sub>1</sub> but not all</i><br><i>at least one but few<sub>1</sub></i>                  | 0100<br>0010 | <i>many<sub>2</sub></i><br><i>few<sub>2</sub></i>                                    |
| L3    | <i>all or few<sub>1</sub></i><br><i>no or many<sub>1</sub></i>                                  | 1011<br>1101 | <i>all or (few<sub>2</sub> if any)</i><br><i>no or (many<sub>2</sub> if not all)</i> |
| L2    | <i>all or (at least one but few<sub>1</sub>)</i><br><i>no or (many<sub>1</sub> but not all)</i> | 1010<br>0101 | <i>all or few<sub>2</sub></i><br><i>no or many<sub>2</sub></i>                       |

- 1 Introduction
- 2 One-sided readings of “many” and “few”
- 3 Two-sided readings of “many” and “few”
- 4 Semantic versus lexical complexity
- 5 Aristotelian diagrams for “many” and “few”
- 6 Conclusion

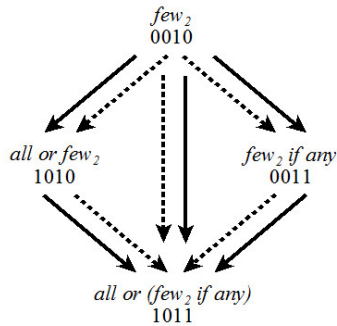

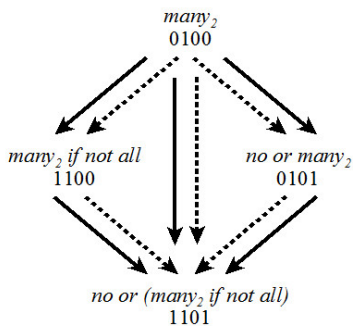

- **discrepancies** between:

- semantic complexity (full line arrows) = entailment  $L1 > L2 > L3$
- lexical complexity (dashed line arrows) = amount of lexical material

- difference in **orientation** between:

- the lattices for semantic complexity = from top to bottom
- the lattices for lexical complexity = from the outside inwards

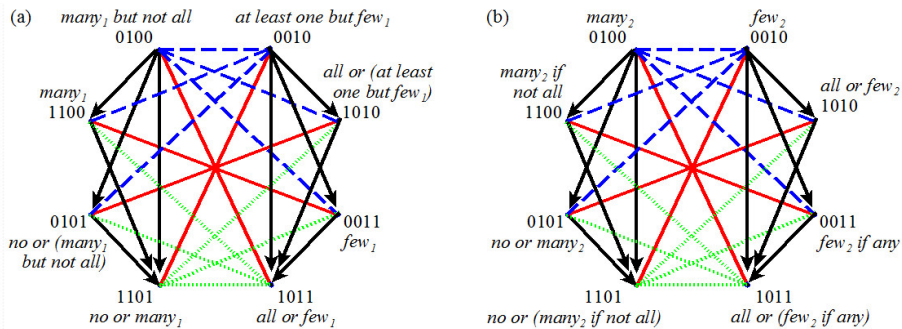

- no more discrepancies between:
  - semantic complexity (full line arrows) = entailment  $L1 > L2 > L3$
  - lexical complexity (dashed line arrows) = amount of lexical material
- parallel **orientation** of:
  - the lattices for semantic complexity = from top to bottom
  - the lattices for lexical complexity = from top to bottom

- 1 Introduction
- 2 One-sided readings of “many” and “few”
- 3 Two-sided readings of “many” and “few”
- 4 Semantic versus lexical complexity
- 5 Aristotelian diagrams for “many” and “few”
- 6 Conclusion

- **contradiction**: 3 diagonals: 2 x L1-L3 and 1 x L2-L2
- **contrariety**: triangle L1-L2-L1
- **subcontrariety**: triangle L3-L2-L3
- **subalternation**: 6 arrows: 2 x L1-L2, 2 x L2-L3 and 2 x L1-L3

- **contradiction**: 2 x L1-L3 and 2 x L2-L2  $\rightsquigarrow$  *many*<sub>1</sub>/*few*<sub>1</sub>
- **contrariety**: 1 x L1-L1 and 4 x L1-L2  $\rightsquigarrow$  *many*<sub>2</sub>/*few*<sub>2</sub>
- **subcontrariety**: 1 x L3-L3 and 4 x L2-L3
- **subalternation**: 4 transitivity triangles L1-L2-L3
- **unconnectedness square**: 4 pairs of L2-L2

cube  
 8 vertices  
 4 x L1  
 4 x L3

octahedron  
 6 vertices  
 6 x L2

rhombic dodecahedron  
 14 vertices  
 \*L0 \*0000  
 \*L4 \*1111  
 $14 = 2^4 - 2 = 16 - 2$

strong JSB  
hexagon

Buridan  
octagon

rhombic  
dodecahedron

rhombicube

- 1 Introduction
- 2 One-sided readings of “many” and “few”
- 3 Two-sided readings of “many” and “few”
- 4 Semantic versus lexical complexity
- 5 Aristotelian diagrams for “many” and “few”
- 6 Conclusion

- discussed Béziau's one-sided analysis of *many*<sub>1</sub>/*few*<sub>1</sub> based on the analogy between the modal logic S5 and the subjective quantifiers.
- proposed an alternative, two-sided analysis of *many*<sub>2</sub>/*few*<sub>2</sub>, which more adequately reflects the relations of entailment (*all*  $\rightarrow$  *many*, and *no*  $\rightarrow$  *few*) and disjunction (*few if any*, *many if not all*).
- compared the two analyses in terms of discrepancies between the scale of semantic complexity and the scale of lexical complexity.
- compared the two analyses in terms of the types of Aristotelian diagrams they generate: identical strong Jacoby-Sesmat-Blanché hexagons but different Buridan octagons/rhombicubes:
  - **contradiction** for *many*<sub>1</sub>/*few*<sub>1</sub>
  - **contrariety** for *many*<sub>2</sub>/*few*<sub>2</sub>

# Thank you!
